

# Opinion: A Shift in Nursing Home Residents to Younger Psychiatric Patients

*The pandemic's toll on nursing homes has opened up beds that younger people, often with mental illnesses, are filling.*

03.09.2021

**O**NE YEAR AGO, a nursing home in Kirkland, Washington, became an early battleground (<https://www.nytimes.com/2020/03/21/us/coronavirus-nursing-home-kirkland-life-care.html>) for the U.S. coronavirus outbreak. The disease has since decimated nursing home populations (<https://www.nytimes.com/interactive/2020/us/coronavirus-nursing-homes.html>) — more than one-third of the

covid 19 related deaths in the US have been nursing home residents & staff,

virtually unnoticed is what has followed in some nursing homes, a shift has occurred in the type of residents who live there, and Covid-19 is one of the reasons.

As older residents die from the pandemic and as more families choose to keep elderly relatives at home, some of these facilities are accepting more younger patients (<https://www.kansascity.com/news/local/article149002179.html>), including some with drug addictions and mental illness. Some patients have schizophrenia. Some have psychosis. This change in clientele can have a dramatic impact on the daily functioning of nursing homes (<https://doi.org/10.1111/jgs.16017>), a change that administrators and staff may be unprepared to handle (<https://skillednursingnews.com/2019/06/despite-demand-nursing-homes-face-major-behavioral-health-hurdles/>).

As a neuropsychologist (<https://ysu.edu/faculty-experts/martin-don>) who has been working in skilled care facilities for more than 25 years, I have seen this transition up close. The migration of psychiatric patients to these facilities began in the

1950's then sped up in the 1980's, when state psychiatric hospitals began rapidly shutting down. Today, about 45% of these hospitals are ~~down~~

closed. The ones still open hold collectively about 37,000 beds, nearly 90,000 short of what's needed (<https://www.governing.com/archive/sl-amid-shortage-psychiatric-beds-mentally-ill-face-long-waits-treatment.html>).

Primarily because of the deaths caused by the pandemic, many nursing homes now have lots of empty beds (<https://www.nj.com/coronavirus/2020/11/at-nj-nursing-homes-empty-beds-continue-eight-months-into-the-pandemic.html>). And to put it bluntly, they need money to survive. The National Health Care Association and National Center for Assisted Living estimate the U.S. long-term care industry will see a 16 percent drop in revenue (<https://www.ahcancal.org/News-and-Communications/Press-Releases/Pages/Long-Term-Care-Faces-Worst-Financial-Crisis-In-Years;-Closures-Loom-Without-Additional-Funding.aspx>) in 2021 and some 1,670 closures or mergers. In some states, nursing homes can be penalized with Medicaid funding cuts (<https://ctmirror.org/2020/09/20/pandemic-deals-another-blow-to-nursing-homes-plummeting-occupancy/>) if their occupancy drops too low.

Even many high-end nursing homes, once solicitors of only the  
affluent have been taking younger patients,

~~that you are happy with it~~

nursing-home-population-the-young), some in their 30s and 40s, most who have only Medicaid.

These younger patients often have coexisting conditions: substance abuse problems along with psychiatric illnesses. Some have lost contact with their families. Some are without income; others are on disability. Often, they have no place to go. Even for those getting help from their families, the cost of extended care is not affordable, nor can families provide the care themselves. Although estimates vary widely, the best assessment suggests more than 125,000 young and middle-aged adults, most with mental illness, lived in nursing homes before the pandemic (<https://www.sandiegouniontribune.com/sdut-mentally-ill-nursing-homes-032209-2009mar22-story.html>).

While federal law requires alternatives to this type of institutionalization for younger patients who spend years in a nursing home, implementation of these laws varies from state to state.

Insurance companies often ~~prefer nursing homes~~ prefer nursing homes

Younger-patients-lacking-options-are-turning-to-1686362.php) as a more cost-effective option than in-home or supervised care, especially for those with severe mental illness. But putting psychiatric patients near elderly and infirm residents can cause problems. Active drug addicts may seek medications, particularly opiates. Active psychotics can be volatile, even violent. These patients may live in nursing homes for years and eventually saturate (<https://bhbusiness.com/2020/01/31/former-nursing-homes-finding-new-life-as-behavioral-health-facilities/>) the facility (<https://www.mcknights.com/blogs/guest-columns/seven-strategies-for-treating-psychiatric-patients-in-snfs/>) with a significant psychiatric population.

The staff members at these homes often don't know how to care for this kind of patient. They need training similar to what's given at psychiatric hospitals. Instead, they can become overwhelmed (<https://www.iadvanceseniorcare.com/placement-of-mentally-ill-individuals-in-nursing-homes-todays-legal-warfare/>). They deal with behavioral issues, including assaults. Behavioral health nurses have the highest turnover rate (<https://www.americansentinel.edu/blog/2018/01/23/nursing-turnover-and-retention-strategies/>)

*among nursing specialties, One third of them quit within 2 years.*

~~We also believe that we give you a great experience and that if you are not happy with it, we will make it right.~~

For nursing home administrators, this is just one more confounding problem they face. Covid-19 has been a devastating experience for them. The virus has ravaged their facilities. One administrator told me she lost nearly one-third of her residents to this illness. I could relate — more than 100 of my patients have died from Covid-19 in the last year.

Certainly, death is always a presence in a nursing home. But the sheer number of deaths (<https://coronavirus.jhu.edu/us-map>) due to the pandemic has been staggering. Death, grief, and fear are not a good psychological cocktail. The emotional toll on workers is tremendous, and with Covid-19, the already high employee turnover rate has climbed (<https://aspe.hhs.gov/basic-report/covid-19-intensifies-nursing-home-workforce-challenges>). Three administrators told me more than a quarter of their staffs have quit. Many are nursing aides, making barely above minimum wage and justifiably terrified at the prospect of catching a virus that could be lethal. These aides are often the only ones there to hold the hands of patients as they die.

Residents who survive the pandemic have endured tremendous hardships (<https://www.aarp.org/caregiving/health/info-2020/covid-isolation-killing-nursing-home-residents.html>). To be stuck in your room, mostly alone, for a year can be profoundly depressing. Friends die and are removed in the middle of the night. Those who remain, some with dementia, may think their friends and family have abandoned them. Residents testing positive for Covid-19 are generally moved to a different part of the home, which is unsettling for them and increases their confusion and mood swings.

Finding housing solutions benefiting both psychiatric patients and an elderly population is a long-haul problem. Money is one of the answers; the National Alliance on Mental Illness (<https://nami.org/Home>) has lobbied Congress for more. In particular, funds are needed (<https://www.healthplace.com/other-info/mental-illness-overview/finding-group-homes-for-mentally-ill-adults>) for group homes where residents with mental illness can eventually transition back to the community. The Department of Housing and Urban Development offers programs that help the elderly and those

~~with disabilities get safe housing. Generally, a person must receive~~  
with disabilities get safe ~~housing. Generally, a person must receive~~  
medicaid to qualify for these services and decent housing. Generally, a person must receive

demand for any of these alternatives (<https://www.heraldtribune.com/news/20200329/new-housing-for-low-income-homeless-people-with-mental-illnesses-is-coming>) far exceeds availability.

At least the immediate future at many nursing homes is looking better (<https://www.msn.com/en-us/news/us/safest-place-in-the-city-covid-19-cases-in-nursing-homes-drop-89-25-as-residents-get-vaccinated/ar-BB1e3cjo?ocid=uxbndlbng>). Many of my patients have been vaccinated. Death rates are dramatically lower. Facilities now allow family to visit, albeit with strict protocols. Soon residents will be able to socialize with each other again. Still, the pandemic's toll on residents, families, and staff will linger for years. The year 2020 has traumatized many of us, including me.
